Claim 1. (Currently amended) A task processing system, comprising:

a storage for storing an event identifier for each event of a plurality of events, wherein said event identifiers comprise a first event identifier corresponding to a first task;

a task control device for creating a task based on at least one of said plurality of events, wherein said task control device executes a search for said first event identifier to create a second task the same as said first task; and

a task processing device for executing a plurality of tasks, wherein the plurality of tasks comprise said first task and said second task,

whereupon completing said a first task of said plurality of tasks, said task processing device initiates a search for a second another event identifier, and if said second another event identifier is the same as said first an event identifier corresponding to said first task, then processes said a second task corresponding to said second another event identifier using a resource used by said first task.

Claim 2. (Currently amended) The task processing system according to Claim 1, wherein a first resource used by said first task, which is completed, is released from said task processing device toward said storage, when said second another event identifier is not the same as said first event identifier corresponding to said first task.

Claim 3. (Previously presented) The task processing system according to Claim 2, wherein said first resource is released from said storage, when said first resource is transferred from said storage via said task control device to said task processing device.

Claim 4. (Canceled).

Claim 5. (Currently amended) The task processing system according to Claim 1, whereupon completing said first task, said processing device deletes said first event identifier corresponding to said first task from said storage.

Claim 6. (Previously presented) The task processing system according to Claim 1, wherein said storage includes a task resource storing unit.

Claim 7. (Previously presented) The task processing system according to Claim 1, wherein said task control device includes an event checker that identifies said event identifier

DOCKET NO. F-10190

for each task of said plurality of tasks.

Claim 8.   (Previously presented) The task processing system according to Claim 1,
wherein said task control device includes a task creator that creates a task corresponding to
said event identifier.

Claim 9.   (Previously presented) The task processing system according to Claim 1,
wherein said task control device includes a task resource manager that transfers a task
resource, corresponding to said event identifier, to said task processing unit.

Claim 10.   (Currently amended) A task system, comprising:
        a storage for storing an event identifier for each task of a plurality of tasks, wherein
said event identifiers comprise a first event identifier corresponding to a first task; and
        a task processing device for executing a plurality of tasks; and,
        a task control device, including:
                an event checker that identifies said event identifier for each task of said
        plurality of tasks;
                a task creator that creates a task corresponding to an identified event identifier;
        and
                a task resource manager that transfers a task resource, corresponding to said
        task, to said task processing device,
        wherein said task control device further executes a search for said first event identifier
to create a second task the same as said first task;
        whereupon completing said a first task of said plurality of tasks, said task processing
device initiates a search for a second another event identifier that corresponds to said second
task, and if said second another event identifier is the same as said first an event identifier
corresponding to said first task, then processes said a second task corresponding to said
another event identifier using a resource used by said first task.

Claim 11.   (Currently amended) The task system according to claim 10, whereupon
completing said a first task of said plurality of tasks, said task processing device deletes said
first event identifier corresponding to said first task from said storage.

DOCKET NO. F-10190

Claim 12.   (Currently amended) The task system according to claim 10, wherein said storage comprises a task resource storing unit that stores a plurality of task resources corresponding to said plurality of tasks.

Claim 13.   (Canceled).

Claim 14.   (Currently amended) A method of processing a task, comprising:
        storing a first event identifier corresponding to a first event and a second event identifier corresponding to a second event;
        creating a first task corresponding to said first event;
        processing said a first task with a first task resource;
        initiating a search for said first event identifier to create a second task the same as the first task;
        determining whether said a first event identifier corresponding to said first task is the same as said a second event identifier corresponding to a second task;
        deleting said first event identifier, corresponding to said first task from an event storing unit upon completion of said processing; and
        processing said second task with said first task resource, if said second event identifier is the same as said first event identifier; and
        acquiring a second task resource and processing said second task using said second task resource, if said second event identifier is not the same as said first event identifier.

Claims 15-16. (Canceled).

Claim 17.   (New) The method of claim 14, further comprising deleting said first event identifier from an event storing unit upon completion of said processing of said first task.
